# Chapter 1

## OOP LAB 1

A simple CLI tool for transforming arrays/sequences to YAML strings and backwards.

This is first lab in MEPHI's OOP course. Specifications can be seen in specifications.pdf file.

### 1.1 Requirements

build-essential (cmake, g++)

For generating documentation install: doxygen, latexmk.

### 1.2 Installation

Clone this repository to your computer.

```
git clone ...
```

### 1.3 Usage

#### 1.3.1 Build

Run build.sh file to compile and run programm.

```
./build.sh 2 # build and run
```

```
./build.sh 3 # build and run with valgring
```

```
./build.sh 6 # for doxygen assemblage. After completion doxygen files can be found in "docs" directory.
```

#### 1.3.2 Interface

After running build.sh follow menus' instructions. This tool has two operation mods: to YAML string (1) and from YAML string (2). Third option in menu is for changing function that is being called in menu options (more details in specification file).

## 1.4 Tests

This lab work can be tested with google tests, which are in a "tests" folder.

To run tests you need to install: libgtest-dev, libgmock-dev.

Use build.sh to compile and run tests:

```
./build.sh 1 # build and run tests
```

To check coverage you can use build.sh with 4 (for task library) and 5 (for dialog functions):

```
./build.sh 4 # Generate coverage files for task directory  
./build.sh 5 # Generate coverage files for dialog directory
```

After running build.sh you can find coverage files in "COVERAGES" directory.

## 1.5 License

MIT

## Chapter 2

# File Index

### 2.1 File List

Here is a list of all documented files with brief descriptions:

<b>run.cpp</b>	??
dialog/ <b>dialogs.cpp</b>	??
dialog/ <b>dialogs.hpp</b>	??
dialog/ <b>get_values.cpp</b>	??
dialog/ <b>get_values.hpp</b>	??
task/ <b>from_yaml.cpp</b>	??
task/ <b>from_yaml.hpp</b>	??
task/ <b>to_yaml.cpp</b>	
Asdfadsgsdadfdsa	<a href="#">5</a>
task/ <b>to_yaml.hpp</b>	??

## Chapter 3

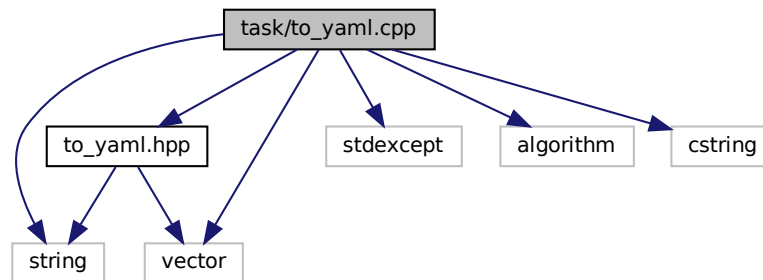

# File Documentation

### 3.1 task/to\_yaml.cpp File Reference

asdfadsgsdadfdsa

```
#include "to_yaml.hpp"
#include <stdexcept>
#include <algorithm>
#include <string>
#include <vector>
#include <cstring>
```

Include dependency graph for to\_yaml.cpp:

### Functions

- bool `check_format` (std::string\_view name)  
*adfasdf*
- size\_t `to_size` (int num)  
*asdfasdgasdg*
- char \* `to_yaml` (const std::vector< int > &array, const char \*name)  
*this is certified hood functions*
- char \* `to_yaml` (const std::vector< int > &array, const char \*name, size\_t in\_size, size\_t &out\_size)
- std::string `to_yaml` (const std::vector< int > &array, std::string\_view name)

### 3.1.1 Detailed Description

asdfadsgsdadfdsa

#### Author

your name ( [you@domain.com](mailto:you@domain.com) )

#### Version

0.1

#### Date

2024-09-19

#### Copyright

Copyright (c) 2024

### 3.1.2 Function Documentation

#### 3.1.2.1 check\_format()

```
bool check_format (
    std::string_view name )
```

adfasdf

#### Parameters

<i>name</i>	
-------------	--

#### Returns

true

false

Definition at line 27 of file to\_yaml.cpp.

```
27     {
28     if (name.size() == 0) return false;
29     if (name.find(" ") != std::string::npos) return false;
30     if (name.find("\t") != std::string::npos) return false;
31     if (!isalnum(name.at(0))) return false;
32     return true;
33 }
```

### 3.1.2.2 to\_size()

```
size_t to_size (
    int num )
```

asdfasdgasdg

#### Parameters

<i>num</i>	
------------	--

#### Returns

size\_t

Definition at line 40 of file to\_yaml.cpp.

```
40 {
41     size_t ans = 1;
42     if (num < 0){
43         ans += 1;
44         num *= (-1);
45     }
46     while (num > 9){
47         num /= 10;
48         ans += 1;
49     }
50     return ans;
51 }
```

### 3.1.2.3 to\_yaml()

```
char* to_yaml (
    const std::vector< int > & array,
    const char * name )
```

this is certified hood functions

#### Parameters

<i>array</i>	
<i>name</i>	

#### Returns

char\* null-terminated string in YAML format

#### Exceptions

<i>invalid_argument</i>	if name is not in YAML format
-------------------------	-------------------------------

Definition at line 60 of file to\_yaml.cpp.

```
60 {
61     size_t out_size;
```

```
62     char* ans = to_yaml(array, name, std::strlen(name)+1, out_size);
63     return ans;
64 }
```
